ANOVA, REML allows for changing variances, so can be used in experiments where some treatments (for example different spacings, crops growing over time, treatments that include a control) have a changing variance structure. The statistical package GenStat is used

log likelihood, the deviance, and the REML deviance. Because we used REML, the log likelihood is the REML log likelihood. Deviance and REML deviance have been defined in various ways. In the lmer() output REML deviance is simply minus twice the REML log likelihood of the data. Ordinary deviance is minus twice the ordinary log likelihood of the data. More about AIC and BIC later.

The Mathematics of REML 1 An introduction to REML REML stands for REsidual Maximum Likelihood or sometimes REstricted Maximum Likelihood or even REduced Maximum Likelihood (Patterson and Thompson, 1971) So what is Maximum Likelihood? The likelihood of a sample is the prior probability of obtaining the data in your sample.

REML Estimation of Variance Components

REML Variance-Component Estimation 781 of a set of independent observations. In this case, the mixed model reduces to $y = 1\mu + e$ (27.1) where μ is the population mean (the fixed effect), 1 is a 1×1 column vector of ones (equivalent to the design matrix X in Equation 26.1), and the covariance matrix

Overview - ANOVA and REML Estimation Methods The basic goal of variance component estimation is to estimate the population covariation between random factors and the dependent variable. Depending on the method used to estimate variance components, the population variances of the random factors can also be estimated, and significance tests can ...

The random/mixed ANOVA models and random intercept model all have the form $Y_{n1} = X_{n1} \beta + Z_{n1} \gamma$

$Y \sim N(\mu, \Sigma)$ where $\mu \sim N(0; \Sigma^{-1})$; $\Sigma \sim N(0; D)$ for some covariance D : simplest model, D is diagonal In this model $Y \sim N(X\beta; ZDZ' + \Sigma^{-1})$: Parameters to estimate: β and any parameters in D . If D is diagonal, then there are q variance components to estimate.

Restricted maximum likelihood (REML) is a method that has been proposed as an alternative to ML, there are a number of justifications; we later provide a Bayesian justification, and here provide another based on marginal likelihood.
