A steam locomotive is a type of railway locomotive that produces its pulling power through a steam engine. These locomotives are fueled by burning combustible material – usually coal, wood, or oil – to produce steam in a boiler. The steam moves reciprocating pistons which are mechanically connected to the locomotive's main wheels (drivers). Both fuel and water supplies are carried with the ...

Steam locomotive - Wikipedia

The type of failures you will get will in a high degree be depending of the quality of the valves different parts and quality and how suited they are compared to the process media and conditions.
