Chapter 6 Multinomial Response Models We now turn our attention to regression models for the analysis of categorical dependent variables with more than two response categories.

In probability theory and statistics, a copula is a multivariate probability distribution for which the marginal-probability distribution of each variable is uniform. Copulas are used to describe the dependence between random variables. Their name comes from the Latin for "link" or "tie", similar but unrelated to grammatical copulas in linguistics [citation needed].

Copula (probability theory) - Wikipedia

Generalized Linear Models 2 That is, in with a binary outcome, the regression of y on x is a conditional probability. If we label $y = 1$ as a "success", then the goal is to model the probability of success given x . The approach to this problem illustrated here is known as logistic regression. Note that other approaches are also possible, notably a probit regression.

May 29, 2012 Generalized Linear Models (GLM)

In Bayesian statistical inference, a prior probability distribution, often simply called the prior, of an uncertain quantity is the probability distribution that would express one's beliefs about this quantity before some evidence is taken into account. For example, the prior could be the probability distribution representing the relative proportions of voters who will vote for a particular ...

A link to an article, "Four Assumptions Of Multiple Regression That Researchers Should Always Test", has been making the rounds on Twitter. Their first rule is "Variables are Normally distributed." And they seem to be talking about the independent variables "but then later bring in tests ...

What are the key assumptions of linear regression

Numerical Recipes in C, Second Edition (1992) Obsolete edition, no longer supported. Please consider using the much-expanded and improved Third Edition (2007) in C++.

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the

underlying biological structure was of hazard rates, and the transformation identified this.

The World Economic Forum's Risk Response Network. Global Risks 2011, Sixth Edition is a flagship product of the World Economic Forum's new Risk Response Network (RRN).. The RRN is a unique platform for global decision-makers to better understand, manage and respond to complex and interdependent risks.

2 7.1 Risk management Risk is the chance or probability of something that may or may not occur; it is something which can be quantified (using standard deviation). Uncertainty is something, which cannot be predicted with statistical confidence, normally due to insufficient information.
